

Trophic Levels

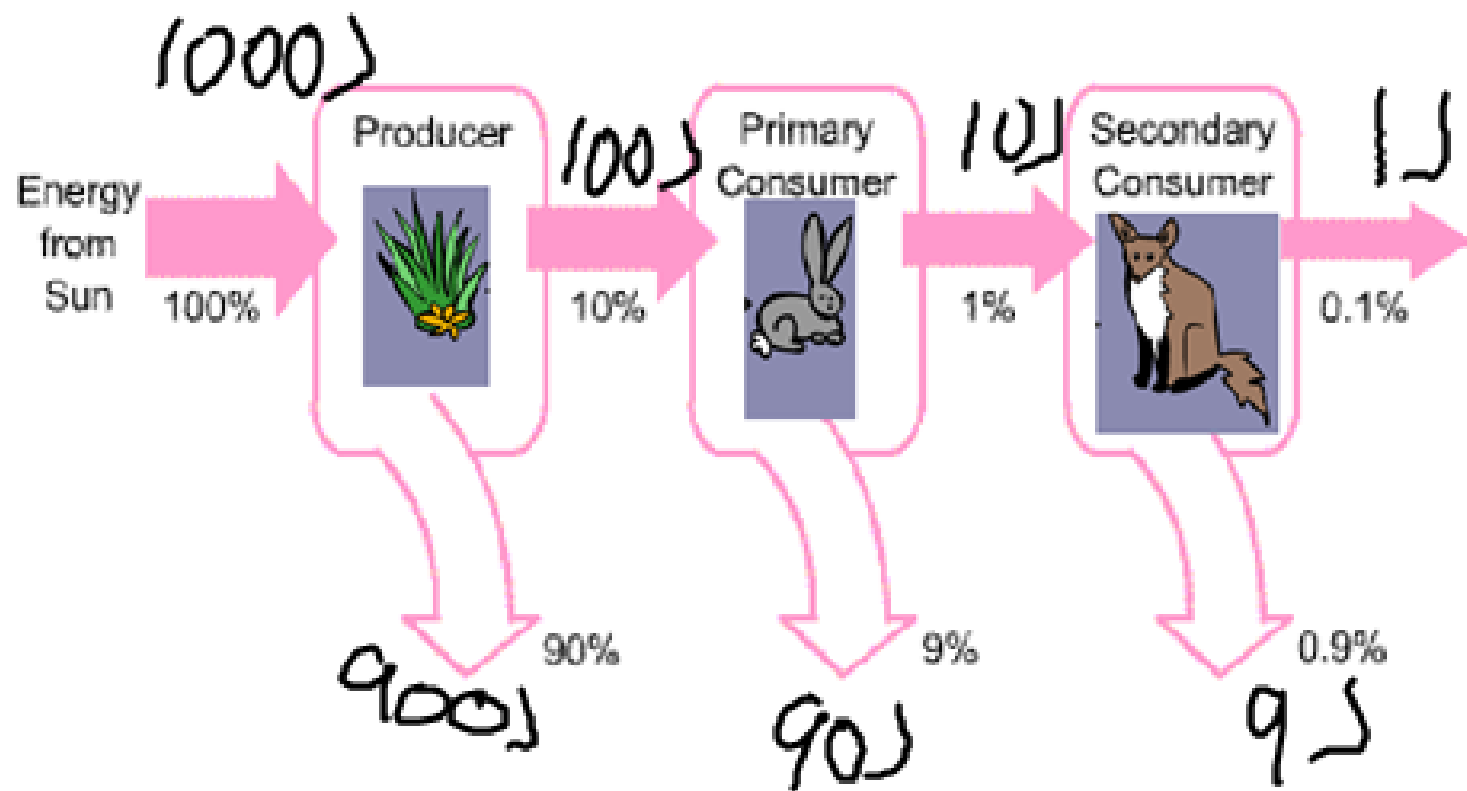

- The levels that each organism occupies in the food chain.
- Each level of the food chain represents one trophic level.
 - Trophic Level One – Producers
 - Trophic Level Two – Primary Consumers (Herbivores)
 - Trophic Level Three – Secondary Consumers
 - Etc...

Energy

- At each level of the food chain, about 90% of the energy is lost through use by the organism.
- The remaining 10% of energy is passed on to the next organism when consumed.
- Therefore, as you move up the food chain, there is less energy available.
- Animals located at the top of the food chain need a lot more food to meet their energy needs.

To do:

Notes – Trophic Levels

Sheets:

- Going with the flow
- Getting to the top
